

Where the conditions differ, by DoF across the three elevation planes

rows = joint × DoF, three elevation planes each, one shared abscissa. Scapular plane has NO compared cell in the whole sweep (≤ 2 ex-vivo shoulders everywhere).

bars = 95% CI of the mean difference · K = this cell's own spline df, chosen by BIC (* = the minimum sat on a grid endpoint) · stars = likelihood-ratio test, Bonferroni-adjusted across the whole plate
