

sagittal plane elevation — random spline, per-cell df by BIC, D diagonal

orange = ex vivo, green = in vivo · line = population curve, band = 95% CI. No knots are drawn.

stars = LIKELIHOOD-RATIO TEST of H0 'no ex-vivo departure' against H1, Bonferroni-adjusted across every compared cell on the plate: *** p<0.001, ** p<0.01, * p<0.05, ns = not significant.

ex/in · studies ex/in | K, this cell's own spline df chosen by BIC | mean and max $|\Delta|$ in degrees. Curves span the full abscissa — every x any shoulder reaches is fitted, so the thinnest stretches rest on a single shoulder and the 95%
